Requirement Analysis Phase

Project Title	implement client script and ui policy (incident)
Team Name / ID	s.ezhilmanibala,ilakiya,lathika,Saravanan,durai balaji
Team Members	Team3
Date	30.09.2026

1. Project Overview

- The system enforces data integrity on ServiceNow Incident records using a UI Policy and Client Scripts. It makes fields mandatory or read-only, auto-populates Urgency and blocks invalid submissions when Impact is High.
- **In scope:** UI Policy and UI Policy Actions, onChange / onSubmit / onCellEdit Client Scripts on the Incident table, and functional testing. **Out of scope:** server-side Business Rules, Flow Designer, notifications and integrations.

2. Functional Requirements

ID	Requirement	Priority
FR-1	The system shall allow authorized users to log in to ServiceNow and open the Incident form.	High
FR-2	When Impact = 1 - High, Assignment group shall become mandatory.	High
FR-3	When Impact is changed to High, Urgency shall be set to 1 - High automatically and an information message shown.	High
FR-4	When Impact = 1 - High, Urgency shall become read-only.	High
FR-5	The system shall block saving when Impact is High and Assigned To is empty, showing an error on the field.	High
FR-6	When Impact is no longer High, mandatory / read-only behaviour shall be reversed automatically.	Medium
FR-7	The system shall block editing of State from list view and show an alert.	Medium
FR-8	State shall remain editable from the Incident form.	Low

3. Non-Functional Requirements

- **Performance:** rules run in the browser, so the form responds instantly with no extra server calls.
- **Security:** access needs ServiceNow authentication; only users with admin / configuration roles can change the rules.
- **Usability:** clear, short messages placed next to the affected field; easy for first-time users.
- **Reliability / Availability:** depends on ServiceNow instance availability; a Personal Developer Instance may hibernate when idle and needs to be woken up.

4. Hardware & Software Requirements

- **Hardware:** laptop / desktop with Intel i3 or equivalent, 4 GB RAM (8 GB recommended), 1 GB free storage, stable internet connection.
- **Software:** Windows / Linux / macOS, Chrome or Edge browser, ServiceNow Personal Developer Instance, JavaScript (Client Scripts), screen-capture tool.

5. Stakeholders & Users

- **Service desk agents (end users):** a simple form that prevents mistakes while logging incidents.
- **Resolver groups:** incidents that arrive complete and correctly routed.
- **Service managers:** accurate data for SLA and reports.
- **ServiceNow administrator:** easy configuration and maintenance of the rules.

6. Constraints & Assumptions

- **Constraints:** short project duration, no budget (free developer instance), client-side technology only, sample data only.
- **Assumptions:** users work in the standard Desktop UI, the Impact choice value '1' means High, and the team has admin access to the instance.

7. User Stories / Use Cases

- As a service desk agent, I want Assignment group to be mandatory for High-impact incidents so that they are always routed correctly.

- As a service desk agent, I want Urgency to be set automatically when Impact is High so that priority stays consistent.
- As a service manager, I want incidents without Assigned To to be blocked when Impact is High so that reports stay accurate.
- As an administrator, I want State changes blocked in list view so that validations on the form cannot be bypassed.
- As a service desk agent, I want the rules to reverse when Impact is lowered so that I can update the incident without extra restrictions.

8. Feasibility Study

- **Technical:** feasible; UI Policies and Client Scripts are standard features and the team has the basic ServiceNow and JavaScript skills needed.
- **Economic:** estimated cost is nil because a free Personal Developer Instance and existing hardware are used.
- **Operational:** easy to adopt, since users see the rules directly on the form and need no training.

9. Requirement Validation

- Requirements were reviewed with the project guide / mentor and updated based on feedback before being approved.
- **Traceability:** each requirement maps to a feature and a test case, as shown in Section 10.

10. Notes / Space for Diagrams

Requirement traceability table:

Requirement	Feature / Component	Test case
FR-1	ServiceNow login, Incident form	Prerequisite for all tests
FR-2	UI Policy Action: Assignment group (mandatory)	TC-02
FR-3	onChange Client Script (Impact)	TC-03
FR-4	UI Policy Action: Urgency (read-only)	TC-03
FR-5	onSubmit Client Script	TC-01, TC-04
FR-6	UI Policy: Reverse if false	TC-05
FR-7	onCellEdit Client Script (State)	TC-06
FR-8	Standard Incident form (no restriction)	TC-07
